

Stereochemistry Worksheet

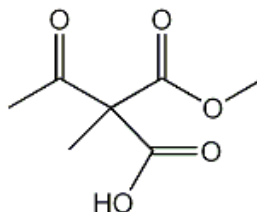

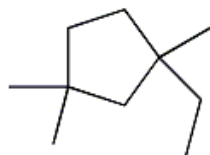

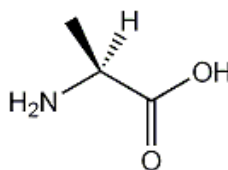

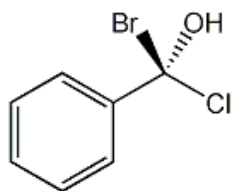

1. Determine if the following molecules are chiral or achiral and indicate stereocenters present in each molecule with an asterisk (*).

2. For each of the following molecules, indicate stereocenters with an asterisk and designate each stereocenter as *R* or *S*.

3. Assign priorities to each group (or atom) bonded to the lone stereocenter in the following molecules:

4. Compare the molecules on the left with each molecule from the right hand set. Label each molecule from the right hand set as the same, an enantiomer or a diastereomer.
