Problem set 3 question 1

Personally, the nanomaterials concentration interests me immensely. I am considering doing a Material Science minor, and the entire subject of studying and creating complex materials that are able to outperform other materials really appeals to me. The nanomaterials concentration for chemical engineering would be something that would allow me to do research and development for physical materials that can have an impact in the real world.

One of the many classes required for this concentration would be MSE 201, Structure and Properties of Engineering Materials. After reading the description, it sounds like an interesting class, talking about the structure and composition of metallic and nonmetallic materials and the relationships between them. Being a very hands-on person, I think I would very much enjoy the class, provided that the teacher is a good teacher. Otherwise, I am interested in the course because if I plan on doing research and development as a job in the future, being able to understand the materials I would be working with is important.
