

1a) The last math class I had was MA 141 Calculus 2 with Professor Silverstein. It was a massive burden, he explained things too quickly, didn't accept any questions (he would just yell at you for being incompetent) and we practiced some things in class but it was primarily the recitations where I learned how to actually do problems.

1b) Doing many practice problems and doing homework with others so as to understand the problem and reinforce the techniques.

1c) I'm worried about the randomness of techniques and applications as it was in Calc 2, but from what I've heard Calc 3 is a lot of number crunching and the techniques make sense and grow on each other instead of being unrelated.

2) I took Chemistry of Energy in high school and loved it. We got to burn things in calorimetry labs, work with acids and bases and titrations, and the teacher was nice, well spoken, and explained things clearly.

3) I just hope you explain things clearly and go slowly. So far, it has been good, the fact that you write your work as we go along helps with the pace. (Dr. Silverstein had everything pre-written, so he just read it aloud which was too fast to follow properly.
